How Do You Create a Health System?

- Collaboration
- Interdisciplinary Teams
- Human Factors Analysis and Design
- Aligned Financial Incentives
  - Physicians
  - Hospitals
  - Insurers / Employers

Educational Change
Cultural Change
How Do You Create a Health System?

- Information Systems
- Rapid Adoption of Best Practices
  - Not 17 years from research to practice
  - Acceptance of practice guidelines & clinical pathways as a means to reduce variation and improve quality
  - Evidence Based Practice
- Data Driven Outcomes Analysis
Key Points

- Aims
- Rules

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
Aims for the 21st-Century Health Care System

- **Safe** – avoiding injuries to patients from the care that is intended to help them.

- **Effective** – providing services based on scientific knowledge to all who could benefit and refraining from providing services to those not likely to benefit (avoiding underuse and overuse, respectively).

- **Patient-centered** – providing care that is respectful of and responsive to individual patient preferences, needs, and values and ensuring that patient values guide all clinical decisions.

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
Aims for the 21st-Century Health Care System

- **Timely** – reducing waits and sometimes harmful delays for both those who receive and those who give care.
- **Efficient** – avoiding waste, including waste of equipment, supplies, ideas, and energy.
- **Equitable** – providing care that does not vary in quality because of personal characteristics such as gender, ethnicity, geographic location, and socio-economic status.

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
Ten Rules

- Care based on continuous healing relationships
  Patients should receive care whenever they need it and in many forms, not just face-to-face visits.

- Customization based on patient need and values
  - The system of care should be designed to meet the most common types of needs.
  - Have the capability to respond to individual patient choices and preferences

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
Ten Rules

- **The patient as the source of control.** Patients should be given the necessary information and the opportunity to exercise the degree of control they choose over health care decisions that affect them.

- **Shared knowledge and the free flow of information.**
  - Patients should have unfettered access to their own medical information and to clinical knowledge
  - Clinicians and patients should communicate effectively and share information

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
Ten Rules

- **Evidence-based decision making.**
  - Patients should receive care based on the best available scientific knowledge
  - Care should not vary illogically from clinician to clinician or from place to place.

- **Safety as a system property.** Reducing risk and ensuring safety require greater attention to systems that help prevent and mitigate errors.

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
Ten Rules

- **The need for transparency.** Make information available to patients and families allowing informed decisions selecting health plans, hospitals, or clinical practices, or choosing among alternative treatments. This should include information describing the system’s performance on safety, evidenced-based practice, and patient satisfaction.

- **Anticipation of needs.** The health system should anticipate patient needs, rather than simply reacting to events.

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
Ten Rules

- *Continuous decrease in waste.* The health system should not waste resources or patient time.

- *Cooperation among clinicians.* Clinicians and institutions should actively collaborate and communicate.

Institute of Medicine, *Crossing the Quality Chasm*, National Academy Press, 2001
